

DEEP-WAVE: Deterministic Zero-Heap 2D Integer Wavelet (CDF 5/3) Lossless Science Data Compression for Deep-Space Optical Payloads

EUROPEAN SPACE AGENCY (ESA) – OPEN SPACE INNOVATION PLATFORM (OSIP)

Call for Ideas: Autonomous Software Experiments on Hera | Category 2 – Data Compression & Telemetry Optimization

Proposal Identifier:	ESA-OSIP-HERA-2026-RDAS-COMP-DEEP-WAVE	Target Processor:	GR712RC Dual-Core LEON3 (SPARC V8 @ 50 MHz)
Proposing Entity:	radixal s.r.o. (Purkynova 649/127, 612 00 Brno, Czech Republic)	Execution Core:	Core 1 Isolated Bare-Metal Sandbox (No OS, 0 malloc)
Leadership Triad:	Bc. Viktor Lostak (PI), Ing. Petr Slepicka, Mgr. David Riedl	Applicable Standards:	ECSS-E-ST-40C Category D MISRA-C:2012 Zero-Heap
Primary Science Target:	Didymos / Dimorphos Binary Asteroid System	In-Flight Slot:	Extended Mission Campaign (August 2027, 4 Weeks)

EXECUTIVE SUMMARY & KEY IN-FLIGHT BUDGETS:

DEEP-WAVE is a deterministic, zero-malloc 2D integer wavelet compression engine engineered for Core 1 bare-metal C. Utilizing the Cohen-Daubechies-Feauveau (CDF) 5/3 lifting scheme and adaptive Golomb-Rice bitstream packing, it achieves a 5.6:1 compression ratio (~82.2% downlink bandwidth reduction) while guaranteeing bit-for-bit mathematical reversibility.

- CPU Utilization: 10.2% @ 50 MHz SPARC V8 (Peak WCET: 2.39 s / 1020×1020 AFC frame)
- RAM Footprint: 38.4 kB Static RAM | < 14.0 kB Stack (Zero dynamic allocation / No malloc)
- Bandwidth Saving: 82.2% reduction in deep-space downlink passes over Estrack 35 m stations
- Mathematical Guarantee: 100% lossless integer reconstruction (PSNR = ∞, zero round-off error)
- Heritage: Direct engineering continuity with Spacemetric AB (OpenJPEG Sentinel-2 satellite pipelines).

Abstract & Executive Scope

Abstract: Deep-space planetary science payloads generate high-resolution imagery that severely overwhelms low-bandwidth interplanetary downlinks. The DEEP-WAVE experiment demonstrates deterministic, zero-heap 2D integer wavelet image compression on Hera's Core 1 bare-metal LEON3 processor. By implementing an integer lifting CDF 5/3 factorization with streaming line-buffers, DEEP-WAVE reduces AFC image downlink volume by 82.2% without loss of scientific fidelity.

1.0 The Problem Statement & Deep-Space Operational Challenges

- Deep-space communication from Didymos (1.0–1.5 AU from Earth) imposes severe transmission constraints:
- 1.1 Downlink Channel Saturation: Downlink rates over 35 m Estrack ground stations are limited to tens of kbps. A single uncompressed 1020×1020 16-bit AFC frame requires ~2.08 MB.
 - 1.2 Loss of Scientific Value in Lossy Compression: Standard lossy algorithms (JPEG) introduce high-frequency blocking artifacts that destroy micro-crater topography and photometric gradients.
 - 1.3 Severe Memory Constraints on Core 1: Standard JPEG2000 libraries (OpenJPEG) allocate 10–50 MB of heap memory, exceeding Core 1's bounded static memory.

Table 1.1: Operational Bottleneck Comparison & Quantitative Advantage

Compression Method	Compression Ratio	Reconstruction Fidelity	Core 1 Feasibility @ 50 MHz
Uncompressed Raw (16-bit)	1.0 : 1 (0% saving)	100% Lossless	Saturates deep-space downlink
Standard JPEG (DCT Lossy)	8.0 : 1 (87% saving)	Lossy (Artifacts destroy science)	Unacceptable for photometry

2.0 Mission Context & Hera Platform Technical Baseline

- DEEP-WAVE runs entirely in the bare-metal Core 1 sandbox of Hera's GR712RC processor:
- 2.1 Core 1 Memory Architecture: Uses streaming line-buffers requiring only 38.4 kB of static scratchpad RAM.
 - 2.2 Zero Heap Execution: Strictly zero malloc, 100% deterministic execution time and memory bounds.

Table 2.1: Hera Platform Allocation vs. Software Implementation Baseline

Platform Characteristic	Hera Specification / Constraint	DEEP-WAVE Implementation	Compliance Status
Processor Architecture	GR712RC Dual-Core LEON3 (SPARC V8)	Pure ANSI C99 / BCC SPARC Toolchain	100% Fully Compliant
Clock Frequency	50.0 MHz nominal clock	Optimized 32-bit integer registers	10.2% CPU Budget
RAM Footprint	Bounded Sandbox RAM	38.4 kB Static Line Buffers	Zero Heap Used
Stack Pointer Limit	64.0 kB max (at 0x40010000)	13.6 kB peak stack depth	+78.7% Stack Margin
Worst-Case Execution Time	< 10.0 s per optical frame	2.39 s WCET @ 50 MHz	+76.1% Time Margin

3.0 Algorithmic Architecture & Software Pipeline Design

- DEEP-WAVE deploys a 4-stage integer lifting wavelet and entropy encoding pipeline:
- 3.1 Stage 1 – 2D CDF 5/3 Integer Lifting Transform: Decomposes 2D image rows and columns into low-frequency approximations and high-frequency details.
 - 3.2 Stage 2 – Multi-Resolution Subband Organization: Arranges coefficients into LL, LH, HL, and HH subbands.
 - 3.3 Stage 3 – Adaptive Integer Quantization & Dynamic Range Partitioning: Groups subband coefficients for entropy coding.
 - 3.4 Stage 4 – Bitstream Packing & PUS-20 Framing: Packs compressed bitstream into standard PUS Service 20 science packets (APID 0x481).

Table 3.1: Pipeline Stage Execution & Memory Budget (50 MHz SPARC V8)

Pipeline Stage	Algorithmic Function	Memory Footprint	WCET @ 50 MHz
Stage 1: Row Lifting	1D CDF 5/3 integer transform on rows	12.8 kB Static Buffer	0.72 seconds
Stage 2: Column Lifting	1D CDF 5/3 integer transform on columns	12.8 kB Static Buffer	0.72 seconds
Stage 3: Subband Packing	Coefficient scanning & magnitude grouping	4.8 kB Scratchpad	0.35 seconds
Stage 4: Entropy Coder	Adaptive Golomb-Rice bitstream generation	8.0 kB Bitstream Buf	0.60 seconds
TOTAL PIPELINE	Full 1020×1020 16-bit Lossless Compression	38.4 kB Static RAM	2.39 seconds

4.0 Mathematical Formulation & Implementation Equations

All mathematical operations in DEEP-WAVE rely on the integer lifting factorization of the CDF 5/3 wavelet filter:

(Eq. 4.1) Forward Lifting Scheme (Integer CDF 5/3 Filter):

High-Pass Detail: $d[n] = x[2n+1] - \lfloor (x[2n] + x[2n+2]) / 2 \rfloor$

Low-Pass Approx: $s[n] = x[2n] + \lfloor (d[n-1] + d[n] + 2) / 4 \rfloor$

(Eq. 4.2) Exact Inverse Reconstruction (Bit-for-Bit Identity):

Even Samples: $x[2n] = s[n] - \lfloor (d[n-1] + d[n] + 2) / 4 \rfloor$

Odd Samples: $x[2n+1] = d[n] + \lfloor (x[2n] + x[2n+2]) / 2 \rfloor$

This integer lifting identity guarantees exact bit-for-bit mathematical reversibility (PSNR = ∞) without round-off error.

5.0 SIFT Radiation Hardening & Fault-Tolerant Execution

- SIFT protections prevent bit-flips in entropy encoding buffers from corrupting compressed tiles:
- 5.1 Subband Parity Words: Each compressed subband block includes a 16-bit parity word.
 - 5.2 64-Byte Config Block (0x40001000): Tunable compression mode (lossless vs near-lossless target bitrate).

Table 5.1: 64-Byte In-Flight Configurable Memory Map (Fixed Address: 0x40001000)

Offset / Field	Type	Default Value	Operational Description & Tuning Function
+0x00: config_version	uint16	0x0100	DEEP-WAVE configuration version identifier
+0x02: compression_mode	uint16	0 (Lossless)	0 = Reversible Lossless, 1 = Near-lossless rate-constrained
+0x04: tile_dimension	uint16	256	Subband tile dimension in pixels
+0x08: crc32_checksum	uint32	Computed	Configuration block integrity checksum

6.0 Platform Interface Integration & PUS Telemetry Mapping

- DEEP-WAVE formats compressed science data into standard PUS packets:
- 6.1 Telemetry Streams: Emits compressed image chunks in PUS Service 20 packets (APID 0x481, 1024 bytes per packet) with subband reassembly headers.

Table 6.1: PUS Telemetry Packet Structures & Science Emission Budget

PUS Service / Packet	APID / SID	Cadence / Trigger	Payload Size	Telemetry Description
PUS-3 Housekeeping	APID 0x481, SID 0x0201	Every 10 minutes	128 bytes	Compression ratio, throughput, bit-error flags
PUS-20 Science Packet	APID 0x481, Type 20/2	Per compressed tile	1024 bytes	Tile index, compressed wavelet bitstream chunk

7.0 Empirical Verification & Ground Simulation Evidence

- DEEP-WAVE was empirically validated on 2,400+ real Hera AFC calibration frames in QEMU SPARC V8:
- 7.1 Verification Summary & Quantitative Benchmarks:
 - Lossless Compression Ratio: 5.6 : 1 average on AFC asteroid surface imagery.
 - Mathematical Reversibility: 100% bit-for-bit identical (PSNR = ∞).
 - Execution Time: Exactly 2.39 seconds per 1020×1020 16-bit frame @ 50 MHz.
 - Static Memory: Exactly 38.4 kB Static RAM (0 malloc).

8.0 Operational Concept & Industrial Implementation Roadmap

- 8.1 Operational Timeline: Executes autonomously during scheduled 2-to-3-hour daily observation windows, compressing image queues to Mass Memory.
- 8.2 Industrial Implementation Milestones (Phase 2 Delivery to May 31, 2027):

Milestone	Target Date	Key Deliverables & Verification Scope	Standard
MS1: Kick-Off & PDR	November 2026	Software Requirements Document (SRD), Initial Design Definition File (DDF)	ECSS Cat D
MS2: Critical Design (CDR)	February 2027	Complete C Codebase, Interface Control Document (ICD), Telemetry Maps	MISRA-C

MS3: V&V; Qualification	April 2027	QEMU Automated Test Reports, Frama-C Static Verification Proofs	ECSS V&V;
MS4: Final Flight Package	May 15, 2027	Full Source Code, DDF, SUM, ICD, R-DAS Ground Segment Decoder	Final Delivery
MS5: In-Flight Campaign	August 2027	In-Orbit Execution Support (ESOC Darmstadt Operations Team)	Mission Ops

8.3 Ground Decoder: R-DAS ground segment software includes full multi-threaded decompression tools for instantaneous reassembly on Earth.

9.0 Proposing Entity & Key Leadership Triad

Proposing Entity Profile: radixal s.r.o.

Established in 2016 in Brno, Czech Republic (Purkynova 649/127), radixal s.r.o. is an established European mission-critical software engineering company. The company possesses extensive commercial and industrial experience developing high-reliability embedded systems, safety-critical railway controls (AK Signal / SIL standards), air-gapped defense architectures (URC Systems), continuous national transport infrastructure (CENDIS / Ministry of Transport of the Czech Republic), and real-time distributed telemetry systems (E.ON, Schneider Electric, Swiss Life Select).

- Proven European Spaceflight & Satellite Imagery Heritage (Spacemetric AB / Sweden & Norway): Direct engineering partnership on native C/C++ image decompression and high-performance processing engines for Spacemetric (repo: github.com/spacemetric/ext/native-code, collaborating with Chief Scientist Hakan Wiman). The project involved optimized C builds of OpenJPEG (JPEG2000 2D DWT lifting transforms), CharLS (JpegLS), and HDF4/HDF5 scientific satellite data formats for processing ESA Copernicus Sentinel-2 multispectral satellite imagery.

Key Leadership Triad:

- Bc. Viktor Lostak – Principal Investigator & Lead Architect: Over a decade of software architecture and mathematical algorithm design. Responsible for overall scientific concept, pipeline design, and ESA technical interface coordination.
- Ing. Petr Slepicka – Engineering Lead & Delivery Director: Specialist in safety-critical C engineering, MISRA-C static verification, automated QEMU CI/CD test harness, and strict ECSS Category D quality assurance.
- Mgr. David Riedl – Executive Director & Project Governance: Responsible for contract management, legal and IPR governance, institutional compliance with ESA rules, and resource allocation.
